How to deploy ScaleArc for MS SQL Server on Google Cloud Platform from Cloud

Launcher

Release	Document Status	OS Platform	Category
11.0.4	AI		High Availability

QUESTION

How to deploy ScaleArc for MS SQL Server on Google Cloud Platform from Cloud Launcher?

ANSWER

ScaleArc database load balancing is available on the Google Cloud Platform as a virtual machine. The VM image contains the latest version of ScaleArc, optimized for use with

Google Cloud Platform Computer Engine.

Prerequisites:

Google Cloud Platform account.

MSSQL Server (Google Cloud Engine) Database servers on Cloud VMs

Deploy Process:

1. Access the ScaleArc for MS SQL page in Google Cloud Launcher and click on the Launch

On Compute Engine button:

2. Create a new VM instance and specify the deployment name, zone, machine type, and

boot disk.

Note: The minimum VM size supported is 4 cores. In the Firewall section, make sure to

allow http, https, ssh, and 3306 traffic check boxes.

3. Click the Deploy button. The Google Deployment Manager confirms that ScaleArc was

deployed successfully.

4. Once the instance is launched, you can browse to the site address to setup ScaleArc. When you connect to the ScaleArc UI for the first time, ScaleArc presents the *Initial Configuration Wizard*. This wizard captures the basic system settings needed by ScaleArc to operate. You will need to input the randomly generated "Admin Password (Temporary)" from the deployment manager into the "GCP Password" field. For full details of the configuration process, and for instruction on administering ScaleArc, see the [ScaleArc](#)

[for MSSQL admin guide.](#)

If you are experiencing issues with ScaleArc or with any of its features, please contact ScaleArc Support. We are available 24x7 by phone at 855 800 7225 or +1 408 412 7315.
